

Task 1

Below are some initial 'raw' requirements for an online ticket sales system (theatre, concert etc). Identify the Functional and Non-functional components in each sentence and, for the NFRs, state the category into which they fit.

1. Users must be able to browse for events by name or date or venue.
Functional Requirements
2. Searching for events by keywords should also be possible.
Functional Requirements
3. User will select ticket price from those offered and specify the number of tickets they require.
Functional Requirements
4. The system should display availability of the tickets within five seconds.
Non-Functional Requirements
Performance
5. Users must be able to choose their seats and purchase tickets 24/7.
Functional Requirements
6. Only registered customers can buy tickets.
Functional Requirements
7. Daily reports of ticket sales must be generated. These must be retained for two years.
Non-Functional Requirements
Data Retention
8. All data is to be backed up nightly.
Non-Functional Requirements
Availability
9. It should not be possible to double-book tickets (i.e. buy a ticket that has already been sold).
Non-Functional Requirements
Integrity
10. Ad hoc reporting will be required, showing ticket sales over a week. It should be possible to vary that time span and look at any duration up to six months.
Functional Requirements

Task 2

The initial requirements for an online document management system have been captured below:

“The system must be available 24/7. Anybody will be able to browse the catalogue but will need to provide their membership details (username and password) if they wish to download or upload documents. Usernames will usually be an email address and passwords will be at least 8 characters long. If the details do not match any existing members, they will be given the opportunity to register. Users should also be able to register even when they do not want to download or upload. It should be possible for the admin team to cancel membership, but members should not be able to do this themselves. The interface must comply with Disability Access Legislation. A weekly report of all registered members must be produced.”

1. Identify the functionality required and draw a use case diagram to show this and the primary actors who will trigger each use case.

2. Revise your diagram to show any <<include>> and <<extend>>
3. Write a use case specification for one of the use cases on your diagram.

Register,

1. The member goes to the registration page.
2. They enter their email and password to register
3. The receive a confirmation email
4. They are then redirected to the login page where they have to log in.

4. Create a wireframe for this use case. Allow for two alternative scenarios.

Registration Page

Register

Email:

Password:

☐ I

1. Open Registration Page
2. Enter Email and password and Submit
3. **SYSTEM** Checks if the email and password meets the criteria
4. **if** Password not secure
 - 4.1. Display Error message; "Password not strong enough"
 - end if**
5. **if** Email has already been used
 - 5.1. **SYSTEM** Open login page
 - end if**
6. **SYSTEM** Creates a new member account
7. **SYSTEM** Send conformation email
8. Receives confirmation email
9. **SYSTEM** Opens Login Page
10. Enters Login Details
